exe to run on 64-bit (x64) versions of Windows operating systems. 32-bit WOW64 applications can be loaded as a 64-bit process, or the system can load a separate 64-bit version of the same application. When 64-bit version of an application is installed and running, it may detect and use WOW64. 32-bit applications, and their 64-bit version will run on WOW64 until the 32-bit version is completely removed from the system. This allows an administrator to disable WOW64 on a computer that is to be set up for legacy support only, without affecting any applications that still require 32-bit support. WOW64 cannot be disabled in the BIOS of a computer that is only to be set up for legacy support, but the settings may be removed from the system using Group Policy (see Windows XP Mode). Alternate 64-bit addresses As described earlier, 32-bit Windows applications can still run on 64-bit Windows using WOW64. In addition, though, Windows operating systems can assign alternate 64-bit addresses to the same data as the original 32-bit processes. When a 64-bit process is created with these alternate addresses, it can

---

interact with 32-bit data exactly the same way as a 32-bit process. Any and all data used in a process created with these alternate addresses will be in native 32-bit form. I have made a copy of the menu in the.cpp file, and a copy of the menu print function in the.h file. I have the menu print working in the.cpp file, but I am having trouble calling the menu print function in the.h file. Here is my main function: `int main() { int choice = 0; do { char choice2; char choice3; 82157476af`
